

ConcreteGo Web Service API

03.18.2024

V 1.87

—

SYSDYNE TECHNOLOGIES LLC
9 River Bend Drive South, Suite 9D
Stamford, CT 06907

Revision History

Date	Version	Comment
7/10/2019	1.0	initial version
7/31/2019	1.01	add soap communication configuration information
8/28/2019	1.02	add information about signaling unit add information about the IncludeRemovedTicket
10/25/2019	1.10	Item query adding more filters Add new queries for UOM, ItemType, ItemCategory, Location, Plant
12/20/2019	1.11	Add ListOnly option to customer query and project query
12/23/2019	1.12	Add ListOnly option and LocationCode filter to item query
12/24/2019	1.13	Add OrderQuery
12/26/2019	1.14	Add more fields on Order Query
12/30/2019	1.15	Ticket Query add ListOnly option Ticket Query add MixCode filter Add Ticket Batch Result Message Query API
1/17/2020	1.16	Ticket Query add loadTime filter
1/29/2020	1.17	Ticket Query add order by option Ticket Query add WithBatchWeightsOnly filter
4/3/2020	1.18	Item Query/Update UseDosageQuantityUOMInMixDesign
4/10/2020	1.19	Add More Fields on Plant Query Response Add Truck Query Add Employee Query
4/21/2020	1.20	Add ItemID and ItemCode to batch result response
5/13/2020	1.21	Add Credit Code Query
5/19/2020	1.22	Add Division

6/19/2020	1.23	Add Price Category Query Add Accounting Category Query
6/24/2020	1.24	Add Location Update Enhanced Location Query
6/25/2020	1.25	TruckStatus Query Truck Query add more fields Truck Update
6/29/2020	1.26	Employee Update
7/1/2020	1.27	TaxAuthority Query/Update TaxLocation Query/Update TaxCode Query/Update
7/7/2020	1.28	Add Field InActive in customer query/update
7/9/2020	1.29	Item Query/Update add more fields Command Line Interface (CLI)
9/25/2020	1.30	Ticket query return user defined fields and terms
10/7/2020	1.31	Add filter Reviewed to Order and Ticket Query
10/21/2020	1.32	Add TaxOverride to Item Query and Update
01/11/2021	1.33	Add TicketTime filter for ticket query Project Query return more fields
01/21/2021	1.34	Item add field NonTaxableReasonCode
01/26/2021	1.35	Ticket Query support OrderUserDefinedFields
02/09/2021	1.36	Add Job Query and Quote Query
02/10/2021	1.37	Add some Command Line Interface examples
02/22/2021	1.38	Ticket Query return SalemanCode and SalesmanName Order Query return SalesmanName
03/22/2021	1.39	Add ControlPricePrintInOE to customer query response and project query response

		Add ControlPricePrintInOE to project update
03/28/2021	1.40	Add UsageCodeRequiredInOrderEntry in customer and project Query
03/29/2021	1.41	Add attribute Active to Item Location Update Request
03/31/2021	1.42	Add filter OrderID to Ticket Query
04/06/2021	1.43	Add Code to Division Query Response Add DivisionCode to Customer Query and Update
04/14/2021	1.44	Add Order Update Add Ticket Update
04/15/2021	1.45	Add Project Query include Product Option
04/19/2021	1.46	Add Project Update with Products
04/19/2021	1.47	Login2 for https
04/22/2021	1.48	Ticket Query response add PricingPlantCode, CustomerDivisionCode, ProductID, SalesAnalysisCode
04/23/2021	1.49	Add field SchedulingTruckTypeCode in ticket query response
08/17/2021	1.50	Add Invoice Query
8/26/2021	1.51	Ticket Query response includes TaxCodeDescription and TaxCodeShortDescription
9/2/2021	1.52	Fixed typo
10/6/2021	1.53	Truck Employee active field
11/22/2021	1.54	Inventory Transaction Query
12/03/2021	1.55	Inventory Transaction Quantity Adjustments
02/14/2022	1.56	Item Query add Filter FromCreateDate and ToCreateDate
02/17/2022	1.57	Ticket Query add parameter MarkOrderAsInvoiced and MarkTicketAsInvoiced

03/16/2022	1.58	TicketQuery Response include field OrderCurrentStatus
03/28/2022	1.59	TicketQuery Response include fields CustomerID and ProjectID
07/11/2022	1.60	TicketQuery Response include fields PlantID, LocationID, LocationCode, LocationName
07/25/2022	1.61	TicketQuery add filter IncludeSuspendedTicket and IncludeInvoicedTicket, Ticket Query Response include fields Suspended and Invoiced
08/22/2022	1.62	Ticket Query response add more fields to TicketProduct
10/14/2022	1.63	Truck add field VIN, Employee add field Payroll
12/20/2022	1.64	Customer Query response include Sundry Charges
12/23/2022	1.65	Project Query response include Sundry Charges
12/28/2022	1.66	Customer Sundry Charge Update
12/30/2022	1.67	Project Sundry Charge Update
1/19/2023	1.68	Item Query with Batch Code
1/23/2023	1.69	Item Update with Batch Code
1/26/2023	1.70	Item Query with Auto Product
1/30/2023	1.71	Item Update with Auto Product
2/6/2023	1.72	Batch result returns more fields Plant Query return field TruckRentalCostPerHour
2/7/2023	1.73	Truck Status Message Query
4/18/2023	1.74	Add option FailOnOrderLock to OrderQuery and TicketQuery
5/31/2023	1.75	Plant Query Response add more fields
6/23/2023	1.76	Login with Slug
7/14/2023	1.77	Add more fields to order query response

7/20/2023	1.78	Add user defined fields to customer query response
8/4/2023	1.79	Add TaxCode to plant query response
10/16/2023	1.80	Add Customer User Defined Fields to Ticket Query Response
10/17/2023	1.81	Item ProductLink
11/30/2023	1.82	Add field PriceQty and PriceQtyUnit to TicketMessageQuery Response
12/12/2023	1.83	Add CreatedDate filter to ticket query
02/12/2024	1.84	Add more fields to Truck Query and Update
02/15/2024	1.85	Add more fields to Ticket Query
03/01/2024	1.86	Add Batch Inventory Query
03/18/2024	1.87	Update TruckStatus ReturnedMaterialQty

Introduction

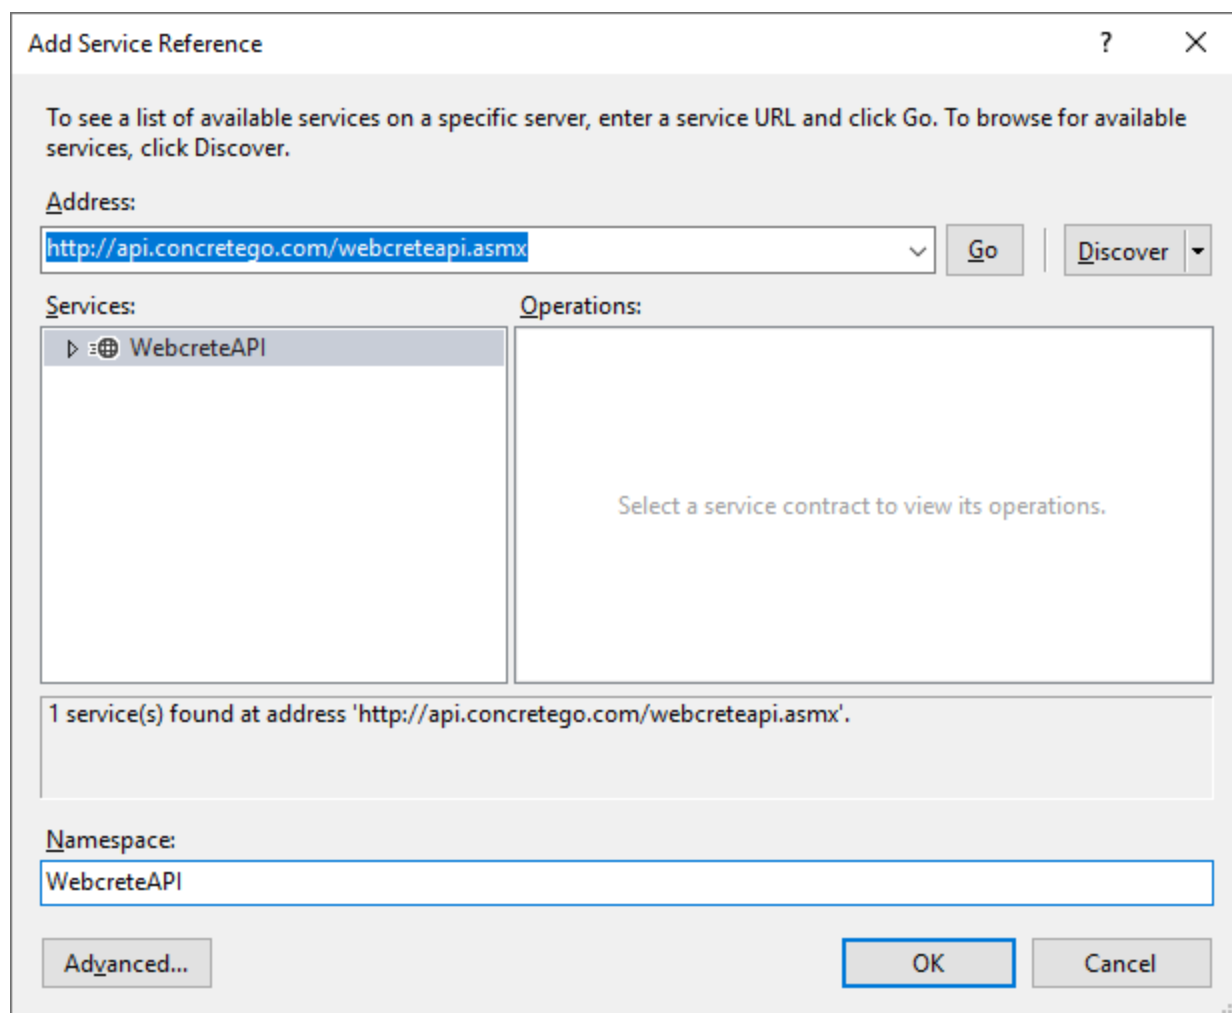

ConcreteGo Web Service API is a SOAP based web service for Sysdyne ConcreteGo Dispatch System. It is used for the integration between ConcretGo.com and third-party systems. The web service url is: <http://api1.concretego.com/webcreteapi.asmx>

Here is an example to add the web service reference in Microsoft Visual Studio 2017:

- First, Right click the References in the solution explorer, then click [Add Service Reference...]

- Fill the address : <http://api1.concretego.com/webcreteapi.asmx> , Click button [Go] to retrieve web service reference information, change the Namespace to [WebcreteAPI], then click OK

After adding the web service reference to the project, we can start to use the api.

If your program target .NET Framework 2.0, you can add web reference by clicking the **Advanced** button

Service Reference Settings

Client

Access level for generated classes: Public

☒ Allow generation of asynchronous operations

☒ Generate task-based operations

☐ Generate asynchronous operations

Data Type

☐ Always generate message contracts

Collection type: System.Array

Dictionary collection type: System.Collections.Generic.Dictionary

☒ Reuse types in referenced assemblies

☒ Reuse types in all referenced assemblies

☐ Reuse types in specified referenced assemblies:

- ☐ mscorlib
- ☐ System
- ☐ System.Core
- ☐ System.Data
- ☐ System.Deployment

Compatibility

Add a Web Reference instead of a Service Reference. This will generate code based on .NET Framework 2.0 Web Services technology.

Add Web Reference...

OK Cancel

In this document, we will only use the service reference.

In the app.config, make sure to add the `maxBufferSize` and `maxReceivedMessageSize` for the soap binding. An example of the app.config looks like this:

```
<?xml version="1.0" encoding="utf-8"?>
<configuration>
  <configSections>
  </configSections>
  <startup><supportedRuntime version="v4.0" sku=".NETFramework,Version=v4.5"/></startup>
  <system.serviceModel>
```

```

    <bindings>
      <basicHttpBinding>
        <binding name="WebcreteAPISoap" maxBufferSize="51200000"
maxReceivedMessageSize="51200000"/>
      </basicHttpBinding>
    </bindings>
    <client>
      <endpoint address="http://api.concretego.com/webcreteapi.asmx"
        binding="basicHttpBinding" bindingConfiguration="WebcreteAPISoap"
        contract="WebcreteAPI.WebcreteAPISoap" name="WebcreteAPISoap" />
    </client>
  </system.serviceModel>
</configuration>

```

Now we can start to call the API.

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;
using MyApp.WebcreteAPI;

namespace MyApp
{
    class Program
    {
        static void Main(string[] args)
        {
            var api = new WebcreteAPISoapClient();
            api.Endpoint.Address = new
System.ServiceModel.EndpointAddress("https://demo-api.concretego.com/webcreteapi.asmx");
            api.Login2(username,password,"");
            //use the api
            api.Logout(ticketHeader);
            api.Close();
        }
    }
}

```

After finish the api calling, make sure call `api.Logout(ticketHeader);`

The endpoint for the web service is in the format of <http://{slug}.api.concretego.com/webcreteapi.asmx>. Where {slug} is the Company's ConcreteGo account/tenant's slug.

For each ConcreteGo account, it has its own endpoint.

The API supports both sync and async calls. In this document, we will only use the sync api for demonstration.

Please check out the example written in C# on GitHub [here](#).

Authentication

The API uses the username/password credentials to authenticate the api access. Before the authentication, we need to create the user account in the ConcreteGo.com. We recommend creating a separate user account for the API access only and disable that user account's web site access.

With the username/password credentials, we can authenticate the api as following:

```
var username = "{your username}";
var password = "{your password}";

var ticketHeader = api.GetPublicKey("Test", "F52D2965BF8318F", out string publicKey);
if (publicKey == null)
{
    throw new Exception("Can not get public key.");
}

RSACryptoServiceProvider key = new RSACryptoServiceProvider();
key.FromXmlString(publicKey);
UnicodeEncoding enc = new UnicodeEncoding();

byte[] encryptedPassword;

encryptedPassword = key.Encrypt(enc.GetBytes(password), false);

if (api.Login(ticketHeader, username, encryptedPassword, null) == false)
{
    throw new Exception("Login failed.");
}
```

We first call `GetPublicKey` to get the public key that will be used to encrypt the password when login. `GetPublicKey` accepts the parameters `appId` and `appKey`.

AppID and AppKey are assigned to each third-party system by Sysdyne. Please contact us if you are developing a new integration program using ConcreteGo API to get the appID and appKey for your program.

Then we use RSA to encrypt the password and call `Login` to pass the username and encrypted password to login. If the api `Login` call is successful, we can call the `ProcessRequest` to start exchanging data.

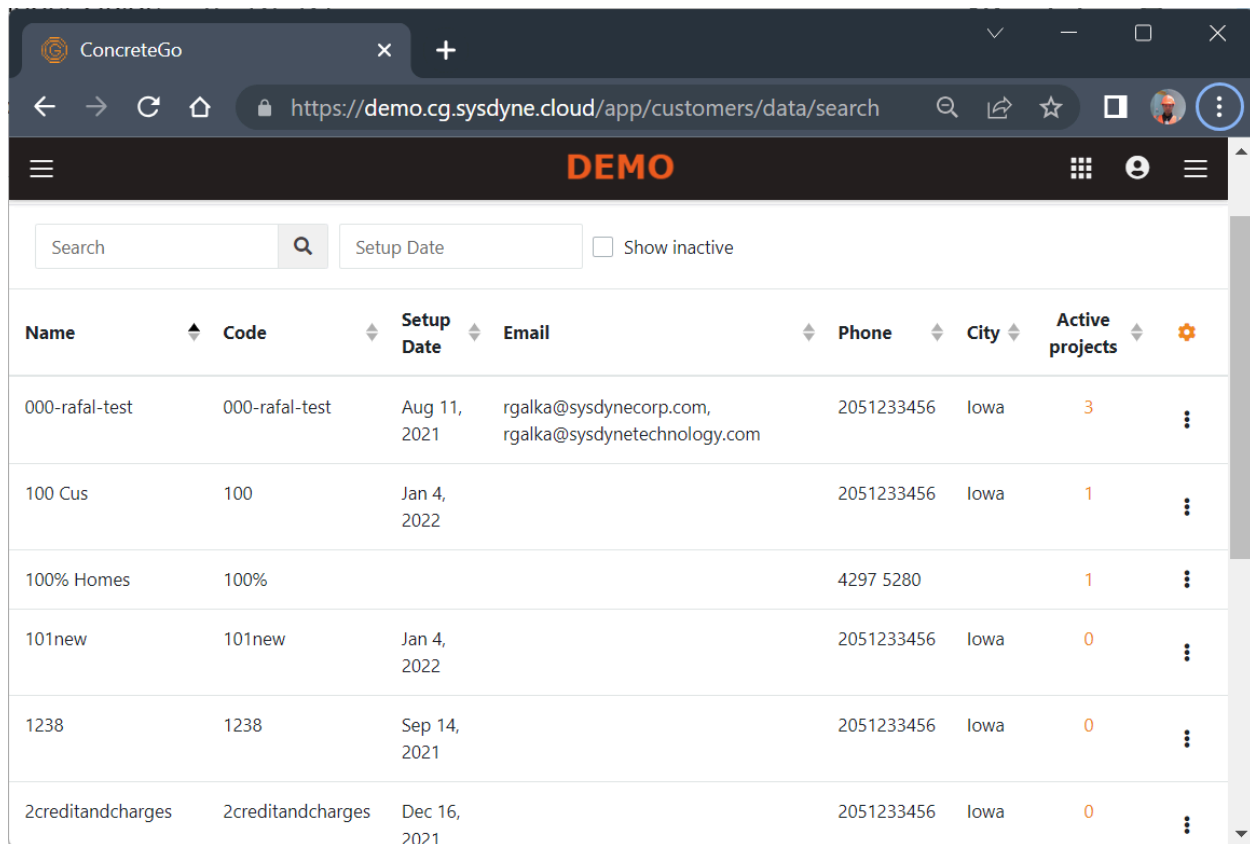

If you access the API through https (**recommended**) . You can also use the `login2` to authenticate directly with username and password.

```
if (api.Login2(ticketHeader, username, password, null) == false)
{
    throw new Exception("Login failed.");
}
```

For each tenant, the API URL for the https will be a different url.

If your username is setup for multiple tenants, you need to specify the slug when you login, the slug can be found through the concretego web portal, after you login, you can see your tenant web site url in the format of <https://{slug}.cg.sysdyne.cloud/>. For example:

Name	Code	Setup Date	Email	Phone	City	Active projects	
000-rafal-test	000-rafal-test	Aug 11, 2021	rgalka@sysdynecorp.com, rgalka@sysdynetechonology.com	2051233456	Iowa	3	⋮
100 Cus	100	Jan 4, 2022		2051233456	Iowa	1	⋮
100% Homes	100%			4297 5280		1	⋮
101new	101new	Jan 4, 2022		2051233456	Iowa	0	⋮
1238	1238	Sep 14, 2021		2051233456	Iowa	0	⋮
2creditandcharges	2creditandcharges	Dec 16, 2021		2051233456	Iowa	0	⋮

The slug for above tenant will be demo

```
if (api.Login2(ticketHeader, username, password, "demo") == false)
{
    throw new Exception("Login failed.");
}
```

An Java example can be found [here](#).

Query Filters

The query request can be provided with different filters to filter the result. For example, the ItemQueryRequest, can use the following filters:

<ListOnly>, <ItemType>, <LocationCode>, <IsConstituent>, etc.

Each filter will affect the result response.

Keep in mind: all those filters can be used as a combination. For example, you can use `<ListOnly>True</ListOnly>` and `<ItemType>Concrete</ItemType>` together to only list the mix items.

The WebcreteAPIExplorer demonstrates more examples of how to use the filters.

Process Request

After login successfully, we can start to send request to the API and get response back from api. Both request and response are in xml format.

```
var response = api.ProcessRequest(ticketHeader, request);
```

The request is in the following xml format

```
<?xml version="1.0"?>
<?webcretexml version="1.0"?>
<WebcreteXML>
  <WebcreteXMLMsgsRq>
    ...
  </WebcreteXMLMsgsRq>
</WebcreteXML>
```

The response is in the following xml format

```
<?xml version="1.0"?>
<?webcretexml version="1.0"?>
<WebcreteXML>
  <WebcreteXMLMsgsRs>
    ...
  </WebcreteXMLMsgsRs>
</WebcreteXML>
```

Version

Request

```
<?xml version="1.0"?>
<?webcretexml version="1.0"?>
<WebcreteXML>
  <WebcreteXMLMsgsRq>
    <VersionQueryRq>
    </VersionQueryRq>
  </WebcreteXMLMsgsRq>
</WebcreteXML>
```

Response

```
<?xml version="1.0"?>
<?webcretexml version="1.0"?>
<WebcreteXML>
  <WebcreteXMLMsgsRs>
    <VersionQueryRs statusCode="0" statusSeverity="Info" statusMessage="Status OK">
      <ConcreteGoVersion>1.0</ConcreteGoVersion>
      <WebcreteVersion>1.0</WebcreteVersion>
      <SupportedWebcreteXMLVersion>1.0</SupportedWebcreteXMLVersion>
    </VersionQueryRs>
  </WebcreteXMLMsgsRs>
</WebcreteXML>
```

C# example

```
public static string GetVersionQueryRequest()
{
    XDocument x = new System.Xml.Linq.XDocument(
        new XDeclaration("1.0", "utf-8", "yes"),
        new XProcessingInstruction("webcretexml", "version=\"1.0\""),
        new XElement("WebcreteXML",
            new XElement("WebcreteXMLMsgsRq",
                new XElement("VersionQueryRq", ""))));

    return x.ToString();
}

var response = api.ProcessRequest(ticketHeader, GetVersionQueryRequest());
```

```

C# example

```

public string GetTicketQueryRequest(DateTime dtOrderFrom, DateTime dtOrderTo)
{
    XDocument x = new System.Xml.Linq.XDocument(
        new XDeclaration("1.0", "utf-8", "yes"),
        new XProcessingInstruction("webcretexml", "version=\"1.0\""),
        new XElement("WebcreteXML",
            new XElement("WebcreteXMLMsgsRq",
                new XElement("TicketQueryRq",
                    new XElement("FromOrderDate", dtOrderFrom.ToShortDateString()),
                    new XElement("ToOrderDate", dtOrderTo.ToShortDateString()))));

    return x.ToString();
}

```

The ticket query does not include the removed tickets by default. If you want to include the removed tickets, make sure to include the following filter in the request:

```
<IncludeRemovedTicket>BOOLTYPE</IncludeRemovedTicket>
```

        new XElement("StatusTimeStamp", statusTimeStamp.ToString("s"))));

    return x.ToString();
}

```

Third party GPS system can use Truck Status Update to sync the truck status to ConcreteGo.

Signaling Unit configuration is required before the integration. In ConcreteGO, each Signaling Unit is configured for each GPS system. Each truck can only be assigned to one signaling unit. The code for the signaling unit is needed in the api calls.

    return x.ToString();
}

```

Exception Handling

When there is an exception happened, the api will return the error message on the returned xml response, for example

```

<?xml version="1.0"?>
<?webcretexml version="1.0"?>
<WebcreteXML>
  <WebcreteXMLMsgsRs>
    <TicketMessageQueryRs statusCode="1000" statusSeverity="Error"
statusMessage="Exception:Can not find field MessageQueueID." />
  </WebcreteXMLMsgsRs>
</WebcreteXML>

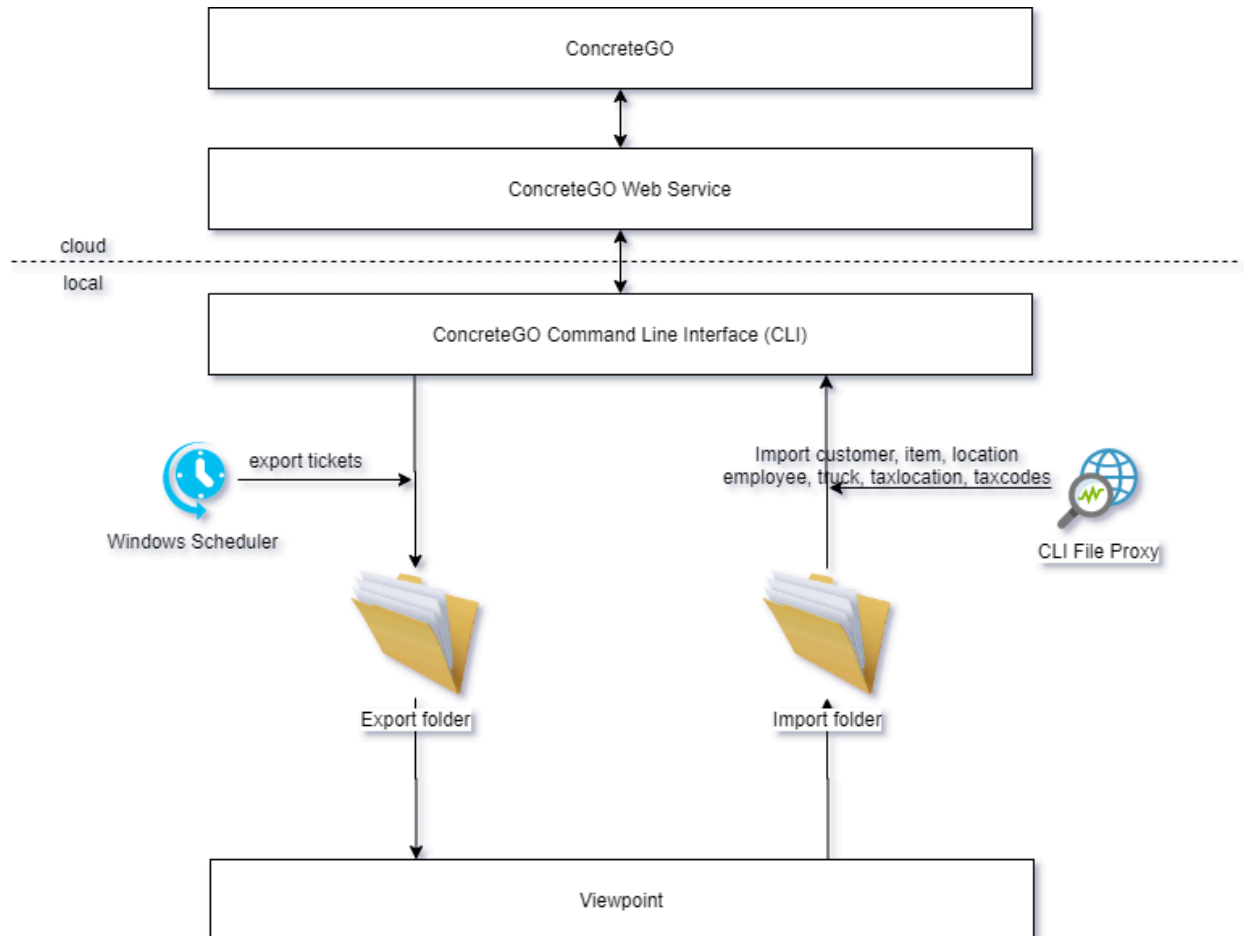

```

Command Line Interface (CLI)

ConcreteGo Command Line Interface (CLI) is built on top of the ConcreteGo Soap Web Service. The main purpose of this interface is to let customers do the application integrations by just using the Powershell scripts without complicated programming work.

➤ How it works

Here is an example of integration with viewpoint

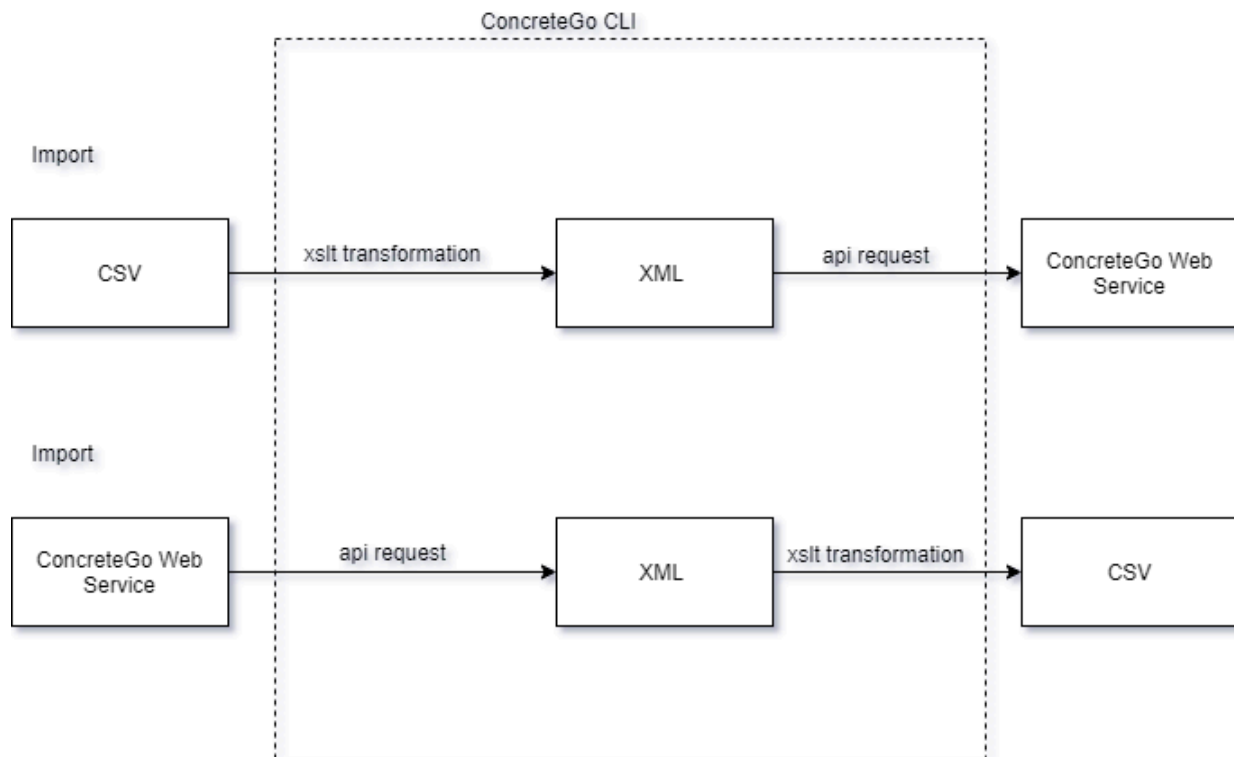

The integration leverages the ConcreteGo Web Service API. It built the ConcreteGo Command Line Interface (CLI) to enable integration capabilities of using Powershell scripts.

We use the Windows Scheduler to run the ticket export script daily to export the tickets into a folder per file per plant.

ConcreteGo Command Line Interface (CLI) File Proxy is a program running as a windows service that monitors the Import folder and runs the corresponding power script to import the file data into ConcreteGo automatically.

Data Flow

The xslt transformation is configured in separated files so that keep the field mapping separated from CLI.

➤ Prerequisites

The integration is supported on Windows 7 SP1, Server 2008 R2, and later versions.

➤ Install

We need to install the following softwares for the integration environment.

Powershell 7

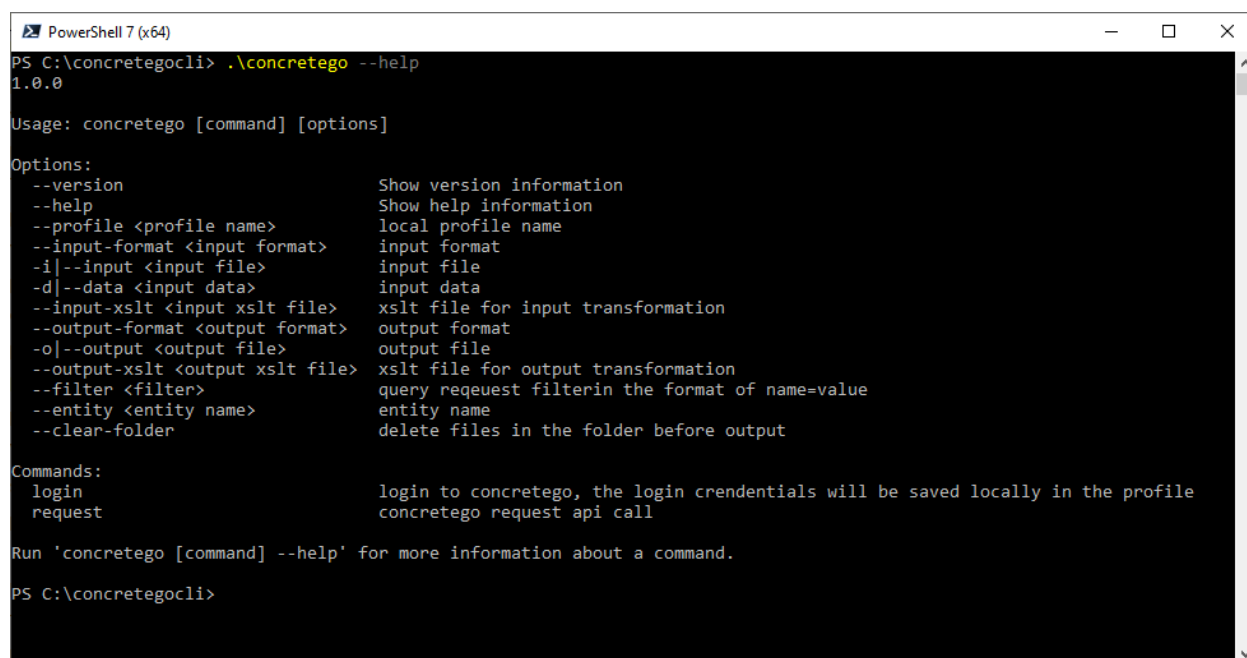

Powershell 7 is needed to run the script to automate the integration.

Download the latest version from [here](#). Choose the Windows x64 msi file and download the file to the local pc. Then run the file to install the Powershell.

ConcreteGo Command Line Interface (CLI)

By default, the ConcreteGo Command Line Interface (CLI) program will be installed under folder `c:\concretegoci\`

```
PowerShell 7 (x64)
PS C:\concretegocli> .\concretego --help
1.0.0

Usage: concretego [command] [options]

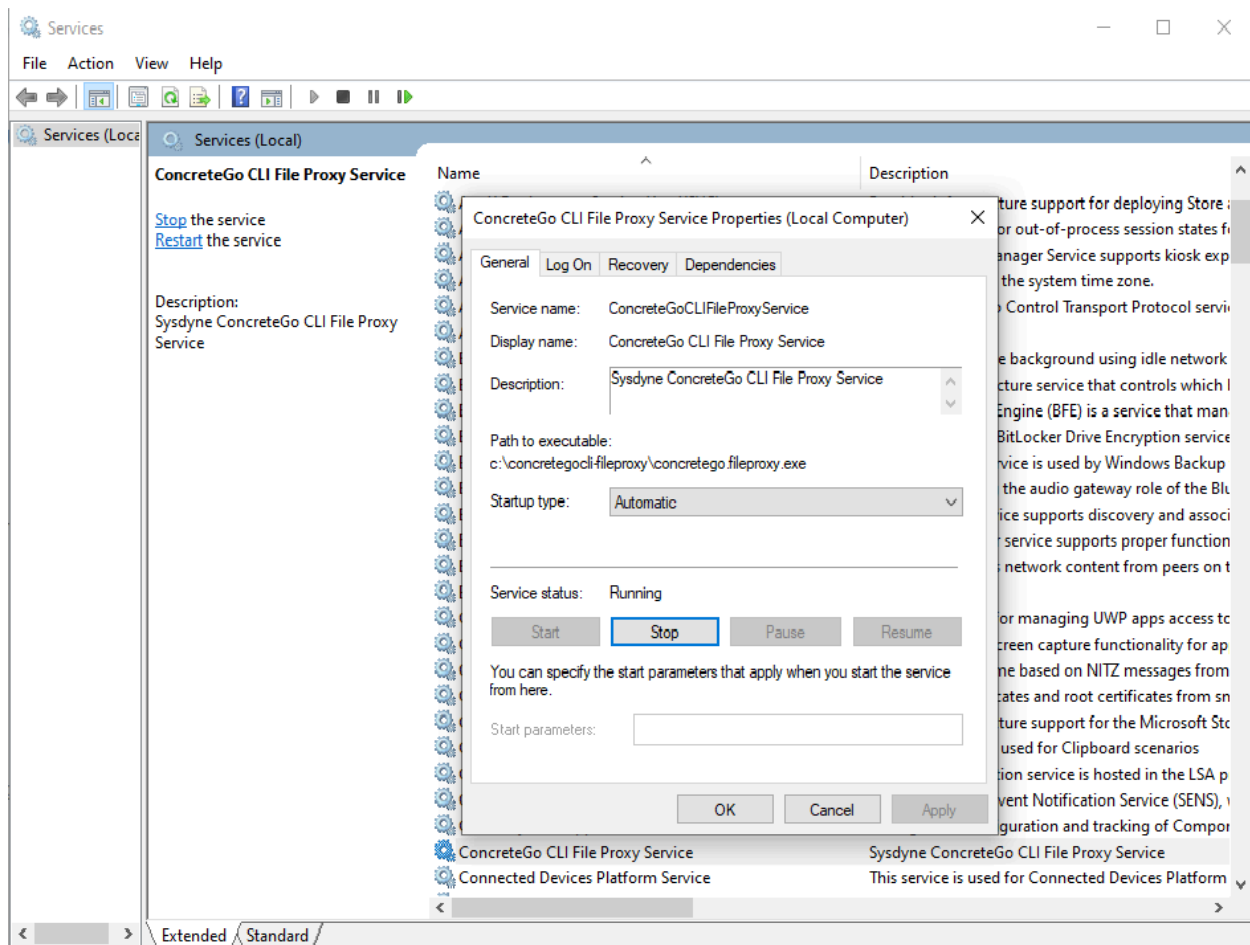

Options:
  --version          Show version information
  --help            Show help information
  --profile <profile name> local profile name
  --input-format <input format> input format
  -i|--input <input file> input file
  -d|--data <input data> input data
  --input-xslt <input xslt file> xslt file for input transformation
  --output-format <output format> output format
  -o|--output <output file> output file
  --output-xslt <output xslt file> xslt file for output transformation
  --filter <filter> query request filter in the format of name=value
  --entity <entity name> entity name
  --clear-folder    delete files in the folder before output

Commands:
  login            login to concretego, the login credentials will be saved locally in the profile
  request          concretego request api call

Run 'concretego [command] --help' for more information about a command.
PS C:\concretegocli>
```

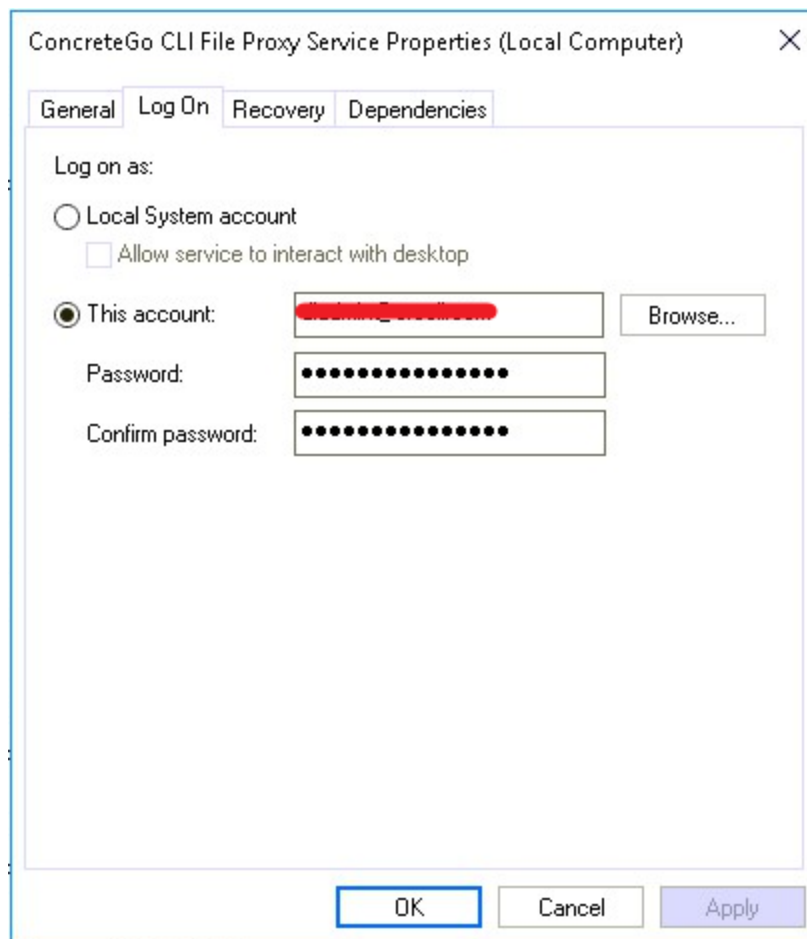

ConcreteGo CLI File Proxy

By default, ConcreteGo Command Line Interface File Proxy will be installed under folder `c:\concretegocli-fileproxy\`. The program will be installed as a windows service.

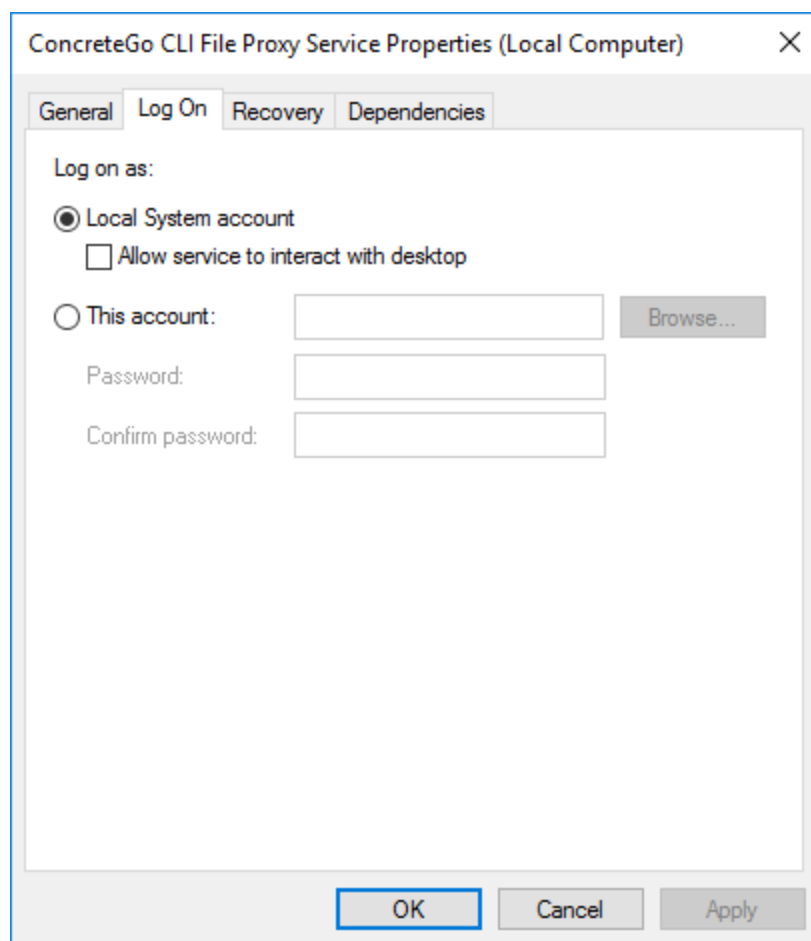

As the command line interface (CLI) login profile/credentials is stored with a specific windows user, the CLI Proxy windows service needs to run under that specific windows user.

We can configure the service run as the current windows user as following

Instead of running it under specific user account, we can also configure the service run under the [Local System Account],

In this case, we need to run the concretego login command under the [Local System Account] so that the profile can be saved under the [Local System Account]. In order to run the concretego login command under the [Local System Account], we need to download the [SysInternals Tools](#), and run the following command as Administrator:

```
psexec -i -s cmd.exe
```

This will run the cmd.exe under the [Local System Account], and then run the ConcreteGo Login command to save the profile under the [Local System Account]. The profile for [Local System Account] is saved under folder: %systemroot%\ServiceProfiles

Concretego --help

```

PowerShell
PS C:\concretegocli> ./concretego --help
1.0.1

Usage: concretego [command] [options]

Options:
  --version                Show version information
  --help                  Show help information
  --profile <profile name> local profile name
  --input-format <input format> input format
  -i|--input <input file> input file
  --no-header             indicate input csv file has no header row
  -d|--data <input data> input data
  --input-xslt <input xslt file> xslt file for input transformation
  --output-format <output format> output format
  -o|--output <output file> output file
  --output-xslt <output xslt file> xslt file for output transformation
  --filter <filter> query request filter in the format of name=value
  --entity <entity name> entity name
  --clear-folder          delete files in the folder before output

Commands:
  login                  login to concretego, the login credentials will be saved locally in the profile
  request               concretego request api call
  request2              concretego request api call with chunks

Run 'concretego [command] --help' for more information about a command.

PS C:\concretegocli>

```

➤ Login

Run the following command:

```

PowerShell 7 (x64)
PS C:\concretegocli> .\concretego.exe login
ConcreteGo Username: yourusername
ConcreteGo Password: *****
ConcreteGo API Host: croell.api.concretego.com
User profile name: [default]
Output format (xml|json|text|table): [xml] _

```

This command will set up the cli's credentials to use for concretego web service api access. ConcreteGo CLI will save these credentials locally. So only need to set this once unless the credentials are changed later.

Warning: if you changed your password, you need to run this command again.

➤ Request

This command will make a concretego web service api call with the specified credentials and parameters.

➤ Request2

This command is the same as Request except that it can specify an parameter Chunksize, which is useful when the request data is too big, it will automatically split the request into multiple requests.

➤ Examples

Export-ticket-by-order-date.ps1

```
1. $TodayString = Read-Host -Prompt 'Order Date'
2. $Today = [datetime]::parse($TodayString)
3. $FileNameSuffix = $today.ToString("yyyy-MM-dd")
4. $FromOrderDate = $today.ToShortDateString()
5. $ToOrderDate = $today.ToShortDateString()
6. ./concretego request --entity Ticket --filter "FromOrderDate=$FromOrderDate" --filter
   "ToOrderDate=$ToOrderDate" --filter="IncludeRemovedTicket=True"
   --filter="IncludeRetElement=USERDEFINEDFIELD" --output-format xml --output-xslt
   ticket-export.xml -o "c:\concretegodata\export\tickets-$FileNameSuffix.txt"
```

Export-ticket-byorderdateplant.ps1

```
1. $TodayString = Read-Host -Prompt 'Ticket Date'
```

```

2. $Today = [datetime]::parse($TodayString)
3. $Plant = Read-Host -Prompt 'Plant Code'
4. $FileNameSuffix = $today.tostring("yyyy-MM-dd") + "-P" + $Plant
5. $FromOrderDate = $today.ToShortDateString()
6. $ToOrderDate = $today.ToShortDateString()
7. ./concretego request --entity Ticket --filter "FromOrderDate=$FromOrderDate" --filter
   "ToOrderDate=$ToOrderDate" --filter "PlantCode=$Plant"
   --filter="IncludeRemovedTicket=True" --filter="IncludeRetElement=USERDEFINEDFIELD"
   --output-format xml --output-xslt ticket-export.xsl -o
   "c:\concretegodata\export\tickets-$FileNameSuffix.txt"

```

Export-ticket-bytickettime.ps1

```

1. $TodayString = Read-Host -Prompt 'Ticket Date'
2. $Today = [datetime]::parse($TodayString)
3. $FileNameSuffix = $today.tostring("yyyy-MM-dd")
4. $FromTicketTime = $today.ToString("s")
5. $ToTicketTime = $today.AddDays(1).AddSeconds(-1).ToString("s")
6. ./concretego request --entity Ticket --filter "FromTicketTime=$FromTicketTime" --filter
   "ToTicketTime=$ToTicketTime" --filter="IncludeRemovedTicket=True"
   --filter="IncludeRetElement=USERDEFINEDFIELD" --output-format xml --output-xslt
   ticket-export.xsl -o "c:\concretegodata\export\tickets-$FileNameSuffix.txt"

```

Export-ticket-bytickettimeplant.ps1

```

1. $TodayString = Read-Host -Prompt 'Ticket Date'
2. $Today = [datetime]::parse($TodayString)
3. $Plant = Read-Host -Prompt 'Plant Code'
4. $FileNameSuffix = $today.tostring("yyyy-MM-dd") + "-P" + $Plant
5. $FromTicketTime = $today.ToString("s")
6. $ToTicketTime = $today.AddDays(1).AddSeconds(-1).ToString("s")
7. ./concretego request --entity Ticket --filter "FromTicketTime=$FromTicketTime" --filter
   "ToTicketTime=$ToTicketTime" --filter "PlantCode=$Plant"
   --filter="IncludeRemovedTicket=True" --filter="IncludeRetElement=USERDEFINEDFIELD"
   --output-format xml --output-xslt ticket-export.xsl -o
   "c:\concretegodata\export\tickets-$FileNameSuffix.txt"

```

Export-ticket-todaybyorderdate.ps1

```

1. $today = Get-Date
2.
3. $FileNameSuffix = $today.tostring("yyyy-MM-dd")
4. $FromOrderDate = $today.ToShortDateString()
5. $ToOrderDate = $today.ToShortDateString()
